

Homework 6

Diagram

Note: didn't include the observer pattern, the assignment never mentioned adding the observer pattern into the UML diagram

Answers

- I think that the composite pattern works better. **First**, I think that it makes more intuitive sense that a zombie would have an accessory and to use composition to have the zombie class hold on to its accessories rather than an accessory having a zombie that it wraps. **Second**, when using the decorator pattern when the accessory "dies" you have to unwrap the internal zombie object. For example, in my code when an accessory "dies" the `GameObjectManager` has to replace that `ZombieDecorator` with the internal `RegularZombie`. This is more expensive than simply having the `Zombie` class handle the accessory.
